

User interface

details TBD

proposal: apps must be capable of windowed and fullscreen.

Dash object interface

The following constructor outlines the fields that every dash must implement.

```
function Dashboard(){  
    //  
    // The dashboard constructor  
    //  
  
    // These fields must be named exactly as they are (by spec)  
    this.devices = null;  
    this.manager_hostname = location.hostname;  
    this.manager_port = location.port;  
    this.user_name = "";  
  
    //... code here  
}
```

In addition to the above interface each dashboard must pass App instances its html element object and a reference to the Dashboard object that invoked it, or at minimum an object that implements the above interface. Once instantiated, Dashboard should run the app's start() method.
